

AUSTRALIAN ENGINEERING EDUCATION STUDENT, GRADUATE AND STAFF DATA AND TRENDS JANUARY 2018

INTRODUCTION

This report and appended data tables are an authoritative resource on the size and performance of engineering in the Australian higher education (HE) system. The aggregated national data cover HE programs at Levels 5 to 10 of the Australian Qualifications Framework (AQF). The relationships between the award levels and external program accreditation by Engineers Australia are summarised.

Most of the data are for the defined field of education, 'Engineering and Related Technologies'¹. Within this field (FoE 03) the higher education programs in 'Engineering' are aligned to the needs and interests of the engineering profession. The principal 'Related Technologies' with higher education qualifications are aviation and spatial sciences. These make up a small proportion of the FoE 03 aggregates. The text includes references to the 'non-engineering' areas where applicable.

The report includes data for the 2016 academic (calendar) year, and provides trends in the aggregates of enrolments, graduations and staffing for up to the last decade. Summary Indigenous student enrolments and completions for all award levels are provided. For Bachelors degrees (including Bachelor Honours degrees), information is provided on student admissions, progression and graduation (completion) rates.

The data presented are sourced from the Australian Government Department of Education and Training (DET) national collections. Student enrolments and related data are supplied to DET by Australia's public universities and other HE providers (VET private providers and TAFE institutes), and are validated by DET before publication. While providers comply with the DET submission requirements, they do not report some datasets completely consistently with each other. Inconsistencies that affect impact interpretation are noted in the text.

Information is also provided from recent national reports on graduate outcomes, for undergraduate and postgraduate degrees, in terms of employment rates, salaries and satisfaction rates, and employer satisfaction. These data are sourced from surveys sponsored by DET. The report provides some comparisons of the national means or median ratings for engineering with other disciplines.

The Australian engineering higher education system is diverse: it includes large and small metropolitan and regional universities, and a small number of private providers. This diversity is reported by including a summary of enrolments, graduations and staffing for each of the 36 ACED members that provide almost all of the nationally accredited programs for entry to professional engineering.

¹ The Australian Standard Classification of Education (ASCED) defines 11 Fields of Education, plus 'Mixed-Field programs. Engineering and Related Technologies is FoE 03. See http://www.abs.gov.au/ausstats/abs@.nsf/0/53B75DFA4C63C20ACA256AAF001FCA6F?opendocument)

1. GRADUATIONS

1.1 Graduations by award level

The total numbers of graduates by award level over 2006-16 are provided in Table 1 of the Appendix. Figure 1 presents a summary showing the growth of graduation numbers since 2006 in the four broad qualification levels: research, postgraduate coursework, bachelors and other undergraduate awards (Associate Degrees, Advanced Diplomas and Diplomas).

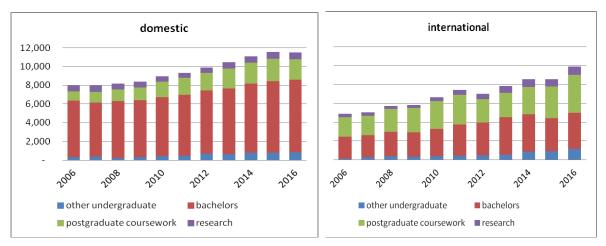

Figure 1 Domestic and international student graduations, 2006-16

1.2 Award levels – external accreditation and professional advancement

Australian education providers must ensure that the programs they offer align with the appropriate level specifications and descriptors of Australian Qualifications Framework (AQF). Engineering education providers also align their programs to the needs of the profession.

Engineers Australia (EA) accredits programs aimed at delivery of the qualifications for <u>entry to</u> <u>supervised practice</u> in three occupations: professional engineers, engineering technologists and engineering associates (or senior technicians), as listed in the following Table. EA specifies the accreditation standards as 'competencies' for each occupation. These standards are benchmarked against those of the educational accords of the International Engineering Alliance IEA². Graduates of EA accredited programs are deemed to have met the required standards for graduate membership of the corresponding category within EA, and are recognised as having equivalent qualifications to those of the other signatories of the relevant accord.

Occupation and EA membership category	Award (full-time equivalent academic years of study, post- secondary school)	AQF Level	International Accord
Professional Engineer	Master (coursework) (5 years) Bachelor Honours (4 years)	9 8	Washington
Engineering Technologist	Bachelor (3 years)	7	Sydney
Engineering Associate	Associate Degree (2 years) Advanced Diploma (2 years)	6	Dublin

The aggregated qualification completion and other student data that are presented against award levels cut across the occupational levels and qualification purposes in two areas:

² The IEA is an self-governed international organisation of professional engineering bodies that each has their nation's responsibility for accreditation of engineering qualifications and standards of engineering practice. At the time of writing, the Washington Accord has 19 full signatories. The Sydney and Dublin Accords have 10 and 8 signatories, respectively. See http://www.ieagreements.org/

- (i) Since 1980, EA has required the accredited professional engineer qualification to be of four fulltime study years' duration (or part-time equivalent) post secondary school. Since 1980, the majority of graduates at many universities have been awarded their degree 'with Honours'. Since 2014 providers been required (in order to comply with the the Australian HE Standards) to reconfigure their four-year degrees as 'Bachelor Honours Degrees' as defined in AQF Level 8. (These are subsequently referred to as BEng(Hons) in the text.) However, some providers are not yet reporting all of these degrees in the 'Bachelor Honours Degree' category. The Bachelor degree data presented in Fig 1 and Table 1 covers both AQF Level 7 and Level 8. (See also Section 4)
- (ii) More than half of the Australian university providers and some private providers are now offering Masters (coursework) degrees accredited by EA to the Professional Engineer standard (known as 'entry to practice Masters'). The aggregated numbers of Masters graduates presented here cover those from both entry to practice Masters programs, and those from coursework degrees aimed at extending the educational base of already qualified graduates.

These overlaps in award designations and purposes thus make it impossible to use the national aggregations to provide exact answers to questions like: '*How many domestic students were awarded an accredited Professional Engineering qualification in a given year?*' or '*How many domestic engineering professionals are taking an advanced Masters degree?*' Subsequent comments on graduations and commencements include observations on such points, on the basis of provider data.

1.3 Graduations: key point and trends

- (i) <u>PhD graduations have almost doubled over the decade.</u> This growth has been predominantly from the near quadrupling of international graduate numbers since 2006. International graduates made up of 55.6% of all the PhD graduates in 2016.
- (ii) The <u>proportion of women</u> in the PhD graduating cohort has tended to increase over the decade, with women making up approximately a quarter of graduates in recent years. Similarly to the previous year, 31% of the domestic graduates from <u>Research Masters</u> degrees were women.
- (iii) <u>Coursework Masters</u> graduate numbers (domestic and international) continued to increase, dominated by international students (71.1% in 2016). Much of this growth is due to the increasing numbers of graduates from accredited 'entry to practice Masters' degrees. The proportions of women (both domestic and international) are consistently a few points higher than for bachelors degrees.
- (iv) <u>Other postgraduate</u> awards (Graduate Certificates and Diplomas) continue to be dominated by domestic students (81% in 2015). These awards are likely to be exit points from advanced Masters programs taken by practicing professionals.
- (v) <u>Bachelors degree domestic graduations rose to their higher-ever number in 2016 (to</u> 7,743), and there was recovery of the international number from a dip in 2015. This total includes approximately 550 graduates from 3-year degrees (see Table 2), many of whom may be studying civil aviation. Many of the engineering graduates at this level articulate to professional engineering degrees.
- (vi) Taken together with known growth of entry to practice Master degree graduations, 2016 must have produced the <u>largest ever numbers of domestic and international graduates</u> <u>qualified to enter professional engineering practice</u>.
- (vii) <u>Associate Degrees and Advanced Diplomas</u> were awarded to more than 600 students for the fifth consecutive year. Many of the engineering graduates at this level use this qualification to articulate into professional engineering degrees.
- (viii) <u>Other undergraduate' awards have nearly quadrupled since 2006</u>: the 2016 total (1,350) includes an increasing number of international graduations; but this may still understate the true number of these, as not all universities assign these <u>foundation diplomas</u> to the engineering field of education. Many of these graduates will articulate to enrolments in Bachelor degrees as discussed in Section 5.

1.4 Undergraduate completions by award duration and branch of engineering

Appendix Table 2 provides details of undergraduate graduations, by duration and 4-digit code subclassification of Engineering and Related Technologies.

The duration of awards provides insights into the types of qualifications being taken:

- (i) The 2-year Advanced Diploma and Associate Degrees awards are taken by a minority of students. Many of these use this qualification to articulate to Bachelor degrees, with advanced standing, rather than seek employment.
- (ii) 3-year Bachelor degrees in engineering may be aimed at the Engineering Technologist accredited qualification, although many in the 0315 Aerospace & Technologies area are likely to be in Civil Aviation for students aiming for this industry, including pilot training. As the latter numbers are probably increasing, it is evident that the 3-year Engineering degree is not attractive to either domestic or international students.
- (iii) 4-year degrees (nominally BEng(Hons) awards dominate graduations for both domestic and international students, as it is these that prepare graduates for accredited qualifications as Professional Engineers.
- (iv) The > 4-year degrees include dual degrees in which students take a second degree (mostly in science or management) alongside their BEng(Hons), or an industry-intensive one-year diploma of engineering practice alongside their BEng(Hons). Relatively few international students are taking these extended degrees.

Many of the universities report their graduations against two generic codes, rather than the available four-digit ASCED codes, rendering it impossible to report precisely on the distribution of graduates amongst the branches of engineering. On the assumption that the universities that do report against the 4-digit codes are typical of the system as a whole, the <u>relative distributions of graduates across</u> the branches of engineering from Bachelor Degrees, Associate Degrees, Advanced Diplomas and Diplomas combined are as in Figure 2. Key points include:

- for <u>domestic students</u>, civil engineering graduations continue to rise, as 'process and resource'³ engineering decrease; there are general downward trends in electrical/electronic engineering and in the mechanical and manufacturing areas;
- (v) for <u>international students</u>, mechanical and civil engineering graduations have picked up, while electrical/ electronics engineering graduations have turned down. Some of these degrees are being offered at offshore campuses.

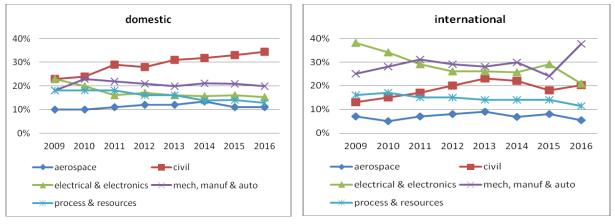

Figure 2 Distribution of undergraduate awards by branch of engineering, 2009-16

With more universities offering accredited entry to practice masters degrees, further data collection and analysis are needed to determine the real trends in graduations by engineering branch, for both domestic and international cohorts.

³ This combination is principally Chemical Engineering and Mining Engineering.

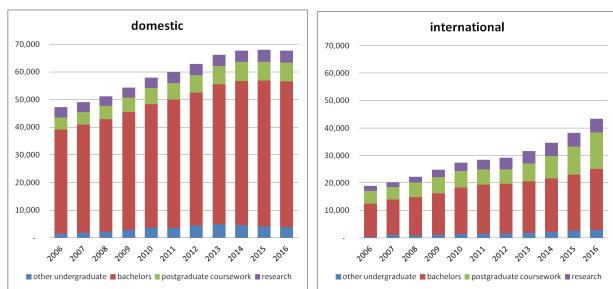

ACED Statistics Jan 2018

2. TOTAL ENROLMENTS AND STUDENT LOAD

2.1 Total enrolments

The data by detailed award level are provided in Appendix Table 3, and summarised in Figure 3 for the broad award level categories. Naturally, total enrolments are the result of commencements (Section 5) and successful progression (Section 6).

The overall growth to more than 110,000 students in 2016 is primarily from international enrolments (10% increase from 2015), with a 20% increase in enrolments in coursework Master degrees. Most of these are in entry-to-practice programs.

Total domestic enrolments appear to have plateaued in 2014-5, for all broad award categories.

Figure 3 Domestic and international student enrolments, 2006-16

2.2 Student load

Funding for teaching and research training is normally based on 'taught student load'. The unit of measurement is one 'effective full-time student (EFT)' in the identified field of education. The following table summarises the load for the Engineering and Related Technologies field over the past five years.

year	doctorate	masters	other p/g	bachelors	other u/g	enabling	non- award	total
domestic 2012	2,304	2,080	766	31,962	1,563	65	33	38,890
domestic 2013	2,225	2,399	756	33,571	1,608	62	49	40,856
domestic 2014	2,378	2,730	746	34,681	1,609	55	69	42,267
domestic 2015	2,588	3,114	629	35,134	1,521	46	58	43,087
domestic 2016	2,695	3,249	546	34,783	1,455	7	51	42,787
% change v 2015	4.1%	4.3%	-13.2%	-1.0%	-4.3%	-84.8%	-12.1%	-0.7%
year	doctorate	masters	other p/g	bachelors	other u/g	enabling	non- award	total
total 2012	5,215	5,913	1,033	44,935	2,275	65	141	59,802
total 2013	5,640	7,192	914	47,220	2,408	62	395	63,999
total 2014	5,904	9,025	876	48,503	2,511	55	1,058	67,931
total 2015	6,207	10,931	749	49,765	2,529	46	975	71,201
total 2016	6,440	13,264	662	50,828	2,600	7	723	74,525
% change v 2015	3.8%	21.3%	-11.6%	2.1%	2.8%	-84.8%	-25.8%	4.7%

The international student load is the difference between the total and domestic load, for each corresponding cell. In line with total enrolments, the balance is shifting towards international load.

Overall load increased by 4.7% from the previous year, largely due to the growth in international students in Masters (coursework) degrees (21.1% in 2016). As discussed later, this growth is principally in EA accredited entry to practice Masters degrees. The distribution of load between the branches of engineering for 2016 is provided in Appendix Table 4.

Assuming all the 2016 load is attributed to teaching engineering students, the 74,525 EFTS load is generated by the 111,059 enrolled students. On average, and as for 2015, each engineering student represents approximately 0.67 EFT of engineering load. The difference between this number and parity is due to part-time enrolment and the contribution of teaching load from other academic areas into the engineering program. The majority of the latter is 'service teaching' of mathematics, science and computing into the first two years of undergraduate engineering.

In Section 6, the load data are combined with staff data to estimate the overall student-staff ratio for engineering teaching and research training.

3. COMMENCING ENROLMENTS

3.1 Aggregates, by level of qualification

Appendix Table 5 provides the details of commencing students numbers by award level. Figure 4 shows the trends for broad levels, over the past decade. Clearly, international commencement growth is underpinning the overall growth. As noted elsewhere in this report, the most recent international growth is primarily in coursework Masters degree enrolments, mostly in accredited entry to practice programs.

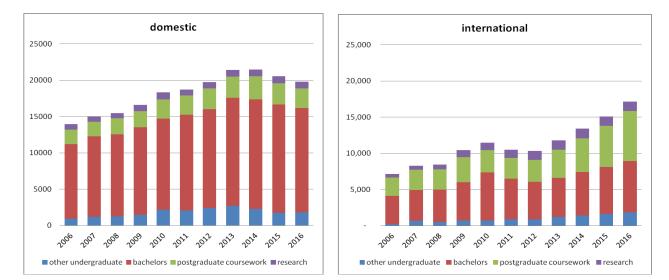

Figure 4 Domestic and international student commencing enrolments, 2006-16

Further comments on 2016 data and trends:

- (i) <u>Doctoral Degree</u> commencements declined slightly in 2016, with the proportion of international enrolments remaining above 60%, as it has since 2012.
- (ii) <u>Research Masters</u> domestic commencing enrolments in 2016 fell to 214, their lowest figure since 2008.
- (iii) <u>Total commencements into Coursework Masters</u> degrees increased by 16%, with 23.6% year on year increase (and 50% increase over 2 years) in international enrolments, primarily in entry to Masters degrees.
- (iv) <u>Total Bachelor degree</u> commencing enrolments were similar to the 2015 figure, although for the second successive year, domestic enrolments fell. As for the previous year, there was a 9% increase in international commencing enrolments at this level.
- (v) Commencing enrolments in <u>Associate Degrees and Advanced Diplomas</u> by domestic students continued to decline from 1,890 in 2013 to 1,136 in 2016, alongside a slight increase (to 236) in international commencements.
- (vi) <u>Enabling courses and Diplomas</u> had more than 11% in both domestic and international growth. As discussed in Section 4.3, these are clearly providing valued pathways into engineering degrees.
- (vii) <u>Women commenced in coursework Masters and Bachelors degrees</u> in similar proportions to 2015. The participation rates of women, at 15.7% for domestic Bachelors students, and 20.9% for coursework international Masters students were both the highest on record.
- (viii) Overall, the proportion of <u>Australian women</u> commencing any award in engineering increased slightly to 16.1%, the highest figure on record. At 19.9% the proportion of women in the international commencing cohort equalled last year's record (see Figure 5).

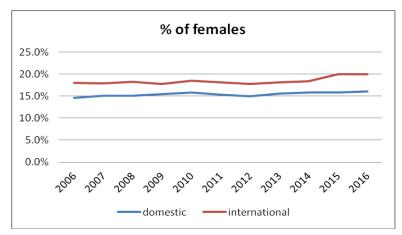

Figure 5 Proportions of women commencing in all awards in engineering, 2006-16

3.2 Domestic commencements across all fields of education

Figure 6 (data in Appendix Table 6) records the numbers of domestic students commencing in Higher Education in several fields of education, for all award levels. The total (405,085) in 2016 was slightly higher than for 2014, the previous highest for any year.

In 2016, and for the second successive year, the proportion of commencing domestic enrolments in engineering dropped, to 4.9% of the total, across all disciplines. This is the lowest proportion on record, and continues a decline evident last year. In contrast, commencing domestic enrolments in both Natural & Physical Sciences (8.8%) and Information Technology (3.0%) increased slightly from their 2015 figures.

Within this declining trend for all awards in Engineering, the proportion of domestic bachelors commencements entering engineering dropped to 5.3%, from a peak of 6.1% in 2013. This decline is partly offset by two universities no longer enrolling students directly into engineering bachelors' degrees⁴. See Appendix Table 7.

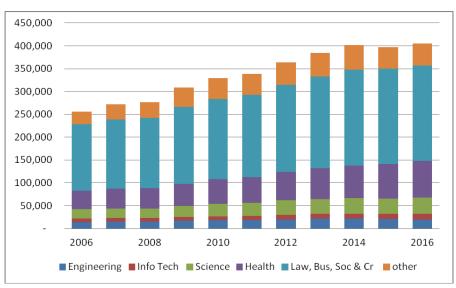

Figure 6 Domestic commencing enrolments (all awards) in selected fields, 2006-16

3.3 Basis of admission into bachelor degrees

The data in Appendix Table 8 shows that non-school-leaver entry has become more common for both domestic and international student categories.

For domestic students, since 2006, the total number of commencing Bachelor degrees students in engineering has increased by about 40%. Within these cohorts, the proportion gaining

⁴ The University of Melbourne and The University of Western Australia admit domestic engineering students into their Masters of Engineering programs, following a Bachelor degree taken with an engineering major. ACED Statistics Jan 2018

admission on the basis of a completed or partially completed higher education award has increased from 13% to more than 23%, indicating the increased use of <u>articulation pathways</u> within higher education. The proportion admitted on the basis of a TAFE or VET qualification has been fairly steady around 7% since 2004.

The proportion admitted on the basis of secondary schooling (and their ATAR rank) has decreased steadily from more than 70% (in 2006) to less than 58% in 2016. The national Undergraduate Admissions, Offers and Acceptances report for 2016 noted that applicants to Engineering constituted 7.9% of the Year 12 applicant sub-cohort. Of these, 67% had ATAR greater than 80.

For *international students*, the admission patterns into Bachelors degrees have been much steadier over the years (while numbers have increased by 70%), with about 30% coming from secondary school, 30% entering engineering from a completed or partially completed higher education award, and a small and declining proportion coming from TAFE or VET.

3.4 Countries of origin of commencing on-shore international students

The international student and graduate data aggregates presented in this report include students in engineering qualifications provided overseas at campuses operated by Australian education providers, or in partnership with local off-shore providers. In 2016, of the total 17,134 international commencing students, 2,257 were offshore.

From the following Table, there has been a 75% increase in commencing onshore enrolments between 2012 and 2016. The countries are listed in rank order of commencing numbers in 2016. China has consistently been the leading source country by a large margin, followed by India. In 2016, these two countries accounted for nearly 60% of on-shore commencing enrolments.

Company of a visit	201	.6	20	15	20	14	20	13	20	12
Country of origin	number	%	%	rank	%	rank	%	rank	%	rank
China (excl SARs,	6.014	12.0	20.4		25.4		24.4		25.2	4
and Taiwan)	6,241	42.0	39.1	1	35.1	1	34.1	1	35.3	1
India	2,437	16.4	15.2	2	15.5	2	12.7	2	8.6	2
Malaysia	690	4.6	5.4	3	6.1	3	7.5	3	6.8	3
Pakistan	633	4.3	4.2	4	3.5	4	2.9	6=	2.6	8
Sri Lanka	436	2.9	2.6	7	2.1	9=	2.1	11	2.3	9
Viet Nam	405	2.7	3.2	5	2.9	5=	2.8	8=	3.2	6
Bangladesh	343	2.3	2.1	9	2.1	9=	2.2	10	2.2	10
Saudi Arabia	304	2.0	2.8	6	2.9	5=	2.8	8=	4.0	5
Indonesia	278	1.9	2.3	8	2.3	8	2.9	6=	2.9	7
Nepal	273	1.8	1.2	14	1.9	13	2.0	12	1.0	15
Total	14,877		12,988		11,261		9,871		8,478	
commencements	14,077		12,900		11,201		5,071		0,470	

Over that period, however, there have been changes in the relative proportions coming from other countries. Noteworthy are the rises of Pakistan, Sri Lanka and Nepal in both proportions and/or rankings, and falls for both Saudi Arabia and Indonesia.

Within each total, the distributions of on-shore commencing enrolments into undergraduate and postgraduate degrees reveal some distinct patterns. Appendix Table 9 provides data for 2015 and 2016, extended to the top 16 countries of origin. These data show:

- (i) for postgraduate research (in 2015), Iran (10.1%), Bangladesh (6.0%), Iraq (5.0%) and Viet Nam (4.6%) were ranked 3rd 6th, after China (33.0%) and India (10.3%);
- (ii) <u>for postgraduate coursework</u> (in 2015), China (43.9%) and India (25.9%) dominate. Only Pakistan (5.7%) had more than 2% of commencing enrolments;
- (iii) <u>for Bachelors degrees</u> (including Honours) (in 2016), Malaysia (11.6%) retained second place behind China (35.5%), and India (6.5%) and Viet Nam (4.3%) in third and fourth places, respectively.

4. COMMENCEMENTS AND COMPLETIONS BY INDIGENOUS STUDENTS

The numbers of Indigenous students in Engineering and Related Technologies reported in the DET data are small, and are very small proportions of the totals.

The following Table shows the national Indigenous commencements and completions in broad award categories over 2011-16. While commencing Indigenous student numbers in Bachelor degrees have increased by 50% since 2011, they remain, in 2016, considerably less than 1% of the total.

	P/G by Res'ch	P/G C'rsewk	Bachelor (inc Hons)	Other		Total	
	Persons	Persons	Persons	Persons	Male	Female	Persons
Commencements							
2011	< 5	13	66	24	87	17	104
2012	< 5	8	60	30	87	13	100
2013	< 5	10	110	21	128	16	144
2014	< 5	14	115	25	136	20	156
2015	< 5	12	108	23	124	21	145
2016	12	2	102	20	115	19	134
Completions							
2011	0	< 5	22	< 5	np	< 5	28
2012	0	< 5	23	< 5	26	5	31
2013	< 5	< 5	25	6	np	< 5	35
2014	0	8	37	7	45	7	52
2015	< 5	11	34	< 5	43	6	49
2016	7		38	10	51	4	55

Further data in Appendix Table 10 breaks down the later data by State and Territory. Since 2012, Queensland has consistently enrolled the largest number of Indigenous students in Engineering, followed by New South Wales.

5. BACHELORS DEGREES: PROGRESSION AND GRADUATION RATES

5.1 Annual success rates

The success rate is defined as the aggregated proportion of courses (units of study) passed by a cohort of enrolled students in a given year. The summary table (from Appendix Table 11) shows the aggregated success rates in 2016 in comparison with immediate previous years, and a baseline of 2001. Data are provided for <u>commencing</u> students (these include students with advanced standing but not in the first <u>program</u> year) and for <u>all</u> students, including those in their commencing year.

Aggregated student success rates do not change much from year to year, but an increasing trend is evident over time for all of the categories shown. In addition:

- part-time students' success rates are consistently lower than those of full-time students;
- women perform consistently better than their male peers;
- international students have higher success rates than domestic students;
- the 'all student' rates are a few per cent higher than those of commencing students, demonstrating that once students are firmly in their program, they will tend to succeed.

		Dom	estic		International				
Success rates	ma	ale	fen	nale	ma	ale	female		
	full-time	part-time	full-time	part-time	full-time	part-time	full-time	part-time	
For commencing students									
2001	82.1	63.7	86.6	65.4	83.6	70.4	88.5	77.2*	
2014	83.3	72.0	87.5	73.0	83.1	78.7	89.6	71.3	
2015	83.9	69.9	87.8	76.7	83.4	75.2	89.4	81.7	
2016	84.4	68.3	87.1	71.2	83.8	80.4	90.5	77.7	
For all students	a (mostly ove	er 3 or more	years of stu	ıdy)					
2001	85.5	72.0	89.5	77.8	85.7	76.6	89.1	80.6	
2014	86.7	74.3	89.8	79.3	85.9	78.7	91.4	83.6	
2015	87.2	75.1	90.4	78.7	86.2	76.9	91.2	82.9	
2016	86.9	73.8	89.2	75.7	86.1	78.8	90.9	74.6	

5.2 Annual retention rates

Retention rates record successful progression to a subsequent year of study, or graduation. The most recent validated data is the retention from 2015 into a confirmed enrolment in 2016, or graduation. Two sets of aggregated retention data are provided here. Retention <u>in the institution</u> allows for students to change program; retention <u>in engineering</u> indicates progression within the degree or change to another engineering program. Up to last year, this data set recorded retention only within the same institution. The 2015 the retention in engineering data has been adjusted by using students' individual identification numbers (CHESSN) to include students who move to another institution.

Retention in the institution:

Similar comments to those for the success rates apply. Indeed, there is a causal relationship between retention and success: a student who does not succeed in passing courses (at least to some extent) will not progress, although may enroll in another program. On average women are retained at higher rates than their male peers.

Retention in engineering:

* small numbers

The change in data collection to adjust for institutional transfer has resolved a long concern about the interpretation of previous retention data. Comparison of the 2014 and 2015 data for domestic students validates ACED's previous estimate of about 8% transfers.

Furthermore, comparison of the retention in engineering with the retention in institution indicates that more domestic students transfer institution and continue in engineering than transfer to another field of study within the same institution. Overall, annual retention in engineering at better than 92% for all categories of full-time student is a strong figure, given the size and diversity of the engineering student population. Women are retained at higher rates than their male peers.

5.3 Completion rates

While the annual success and retention data record aggregated annual progression, stakeholders are also interested in answering such questions as

- (i) 'What proportion of students commencing engineering are likely to complete (graduate) in a given time'; or
- (ii) 'What pathways did a given year's graduates take to get their engineering degree'

ACED previously conducted cohort studies with a representative sample of its members, and deduced that on average, <u>around 65%</u> of those who commence a Bachelor degree in Engineering would complete it, including the estimated 8% transferring to another institution, referred to above. Using student CHESSN data, DET is now able to undertake cohort studies that can answer such questions.

From national completion rate reports, for domestic students <u>commencing</u> Bachelors degrees in Engineering & Related Technologies in 2005 and 2006, after nine years, 74.7% and 75.6% respectively, had graduated. The reported 8-year outcomes account for transfers between providers (HEPs), as summarised here:

Year first enrolled	Gradu	ated	Still enrolled a 8 years coh		Re-enrolled out afte	Never came back after first year	
	same HEP	diff HEP	same HEP	diff HEP	same HEP	diff HEP	
2005	66.5%	6.3%	4.1%	3%	11.4%	2.8%	5.7%
2006	66.8%	6.9%	4.4%	3%	11.3%	2.8%	5.0%

These graduation rates <u>cannot</u> be interpreted as the 'likelihood of completion' of the original degree, because the reported graduation may be in another field of education. These data cannot answer question (i) above.

Question (ii) can be answered, at least in general terms, by data on <u>graduating</u> cohorts. Specifically, for each graduating domestic cohort, the year and institution of commencement in higher education. DET has provided ACED with relevant data for graduating Bachelors degree cohorts in Engineering and Related Technologies.

The following Table shows that at least 90% of the domestic graduates in Engineering commenced in the same institution (confirming earlier findings). The accuracy of future data should increase, with further reduction of the numbers of 'unknowns'.

Year of	Institu	tion of commen	cement	Total	% commencing in	
completion	same	different	unknown	graduates	same institution	
2012	6,096	340	332	6,768	90.1%	
2013	6,338	388	273	6,999	90.6%	
2014	6,702	438	211	7,351	91.2%	
2015	6,894	539	182	7,615	90.5%	

The duration of study to graduation data are also informative. As an example, for the 2015 graduating cohort, the data in the following Table confirms the reasonable assumption that changing institution is likely to increase the overall duration of study by about one year.

Institution of	total					Year of	commen	cement				
commencement	graduates	2015	2014	2013	2012	2011	2010	2009	2008	2007	2006	2005
same institution	6,894	43	113	253	1736	2030	1569	653	248	138	74	37
different institution	539					114	130	98	60	41	31	32
same institution: % of sub-cohort	90.5%	0.6	1.6	3.7	25.2	29.4	22.8	9.5	3.6	2.0	1.1	0.5
different inst.: % of sub-coh	7.5%					21.1	24.1	18.2	11.1	7.6	5.8	5.9

The interpretation of these aggregates is not simple. While their graduation year is fixed, graduates study patterns are diverse, in terms of degree programs (nominally 3-year, 4-year and greater than 4 year), study mode (full-time or part-time), and institutional transfer with or without credit from within the higher education system.

This diversity is illustrated by considering the nominally principal program and mode contained within these aggregates. This is the 4-year BEng(Hons) degree, taken in full-time mode all at the , same institution, typically by a school leaver commencer. If all the graduates in the 'same institution' sub-cohort were in this mode and studied in lock step, they would all have commenced in 2012. Yet it is clear that only 25% of the 2015 graduates did commence in this 'minimum time'.

What is evident from these data is that more than 75% who do study and complete a Bachelors degree in Engineering and Related Technologies in the same institution, do complete within six years of commencement in higher education. This is an important message for stakeholders, some of whom still may believe that the standard engineering degree is of three year's duration. The most recent DET report on completion rates does warn against misinterpretation of its published four-year completion rate data.

6. GRADUATE OUTCOMES

National reporting on graduate outcomes and employment changed in 2016 with their inclusion in the DET Quality Indicators for Learning and Teaching (QILT) initiative. QILT surveys cover graduate satisfaction, graduate outcomes (employment rates and median salaries), and employer satisfaction, for graduates of postgraduate coursework and research programs, as well as those from undergraduate degrees.

Details and recent trends for <u>Engineering employment and remuneration</u> compared with other fields of education are provided in Appendix Tables 14. Key points:

 Engineering graduates from <u>undergraduate</u> programs are gaining <u>full-time employment</u> at higher rates than most other areas, and receive <u>higher median salaries</u>. For those completing in 2015 and 2016:

	% in full-time employment	median salary (first FT employment, < 25 yr olds)	% in any employment
2015 undergraduate Engineering	76.4%	\$ 62,600	83.9%
2015 undergraduates All areas	70.9%	\$ 60,000	86.4%
2016 undergraduate Engineering	79.4%	\$ 64,000	86.5%
2016 undergraduates All areas	71.8%	\$ 59,900	86.5%

- (ii) Trend data (Appendix Table 14 (b)) for undergraduates in the branches of engineering reported in the QILT survey, show all discipline areas other than Electrical & Electronic Engineering have <u>higher full-time</u> employment rates than two years previously.
- (iii) <u>Women</u> (Appendix Table 14 (c)) who graduate from undergraduate programs are paid at higher rates than their male peers.
- (iv) <u>Postgraduate coursework graduates</u> in Engineering gain employment at higher rates and median salaries than other disciplines (Appendix Table 14 (c)). The Engineering graduates are from both entry-to-practice programs and programs designed for qualified engineers to advance their knowledge and skills (and who may already be in employment).
- (v) <u>Research degrees</u> in Engineering are <u>not rewarded</u> with a higher median salary than other disciplines, or a postgraduate coursework degree in engineering (Appendix Table 14 (c)).

The <u>Graduate Satisfaction</u> data reported in the QILT report (See Appendix Table 15(a)) show that of the 2016 Engineering graduates from undergraduate' programs:

- (i) Less than half rated their program in the top two points of a 5-point agreement scale on <u>'Good Teaching</u>'. This is lowest satisfaction amongst all reported areas of education.
- (ii) In contrast, 84.0% gave high ratings to their '<u>Generic Skills</u>' acquisition; higher than most reported areas.
- (iii) Although 75.4% rated '<u>Overall Satisfaction</u>' in the top two points of the 5-point agreement scale, this is a lower proportion than other reported areas.

Postgraduate coursework graduates gave somewhat more favourable ratings. Research graduates rate their experience more highly than other fields, in almost all survey dimensions.

The <u>2017 Employer Satisfaction Survey</u> recruited 'employer' respondents by asking graduates to nominate their supervisor. As volunteers, those who responded were likely to be well disposed towards the graduates. With 89.9% of employers rating Engineering graduates in the top two points of a 5-point agreement scale, the <u>top-rated</u> field of education for 'Overall Satisfaction'. In four of the skills areas (Foundation, Adaptive, Collaborative and Technical), Engineering was rated top or near top (see Appendix Table 15 (b)). Only in 'Employability' was Engineering rated as average. Furthermore, these supervisors rated the importance of the qualification highly, and rated well the extent to which it prepared the graduates for their current employment (see Appendix Table 15 (c)).

7. ACADEMIC STAFF DATA AND STUDENT STAFF RATIOS

From the DET sources, the total academic staff (full time equivalent) in non-casual positions are provided in Appendix Table 16, and Figure 7. However, these totals probably slightly underestimate total engineering academic staffing, because of the combination of two factors:

- some universities with engineering in a multi-field academic structure report either zero engineering staff;
- some universities attribute all of the academic staff in that structure against engineering.

The individual university responses for ACED members are shown in Table 17.

The number of FTE teaching staff (in Teaching-only and Teaching & Research positions) increased in 2016 to its highest-ever value (2,395), but the number of Research-only staff dropped by 112 from its 2015 peak of 1,816.

The FTE number of women in teaching positions increased slightly from the 2015 figure, holding the proportion to 14.6%. The FTE number and proportion of women in research-only positions declined, for the fifth successive year (Fig 8 a). The proportion of women in above-Level C and Level C (Senior Lecturer) positions (Fig 8b) increased very slightly from the 2015 figures.

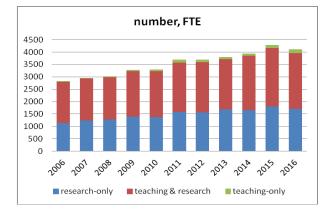

Figure 7 Academic staffing (FTE) in Engineering & Related Technologies, 2006-16

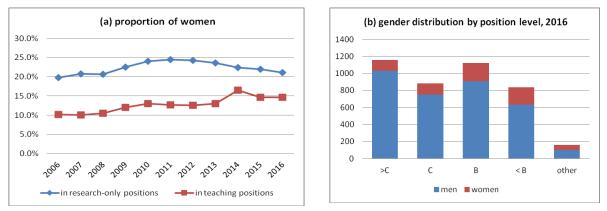

Figure 8 Female engineering academic staff (FTE) in Engineering & Related Technologies: (a) proportions by academic role 2006-16, (b) numbers by gender and position level, 2016

The <u>raw student-staff ratio</u> is approximately (74,525/2,395) = 31.1. This is slightly greater than last year's figure, but is probably an overestimate because of the net under-reporting of staffing numbers. It is also effectively <u>reduced</u> by the contributions of casual staff and research staff to teaching, but may also <u>be increased</u> where staff in Teaching & Research positions are allocated to full-time research or management positions, or are on study leave, and are replaced by casual staff.

Comparable student-staff ratios can be calculated for the member faculties using the data in Table 14. Their interpretation is likely to be institution dependent.

8. DISTRIBUTION OF ENROLMENTS, ETC. FOR ACED MEMBERS

Table 17 provides summary data on the commencing and total enrolments and graduation and staffing from all the ACED members.

From these data it is clear that one institution, the <u>University of New South Wales</u> (including its College at Canberra which is a member of ACED in its own right) has the most enrolments and graduations by some margin.

The sixteen Australian universities in the eleven member Group of Eight Engineering Deans and Associates (that includes Newcastle, Wollongong and Auckland), plus the six 'technology' universities (the ATN group plus Swinburne) have more than 78% of total engineering enrolments, and nearly 85% of international enrolments.

9. CONCLUDING COMMENTS

As in previous years, Tables 2 and 17 raise questions about the completeness and accuracy of the data that ACED member universities are providing to the Higher Education Statistics Unit.

I can provide ACED members with their own items if they are interested, although it would be very time consuming to extract a set for each member. In addition, members should interrogate their own university statistics units to gain insight into any data that appear anomalous.

10. SOURCES

The enrolments, graduations, basis of admission, success, retention and completion and staffing data presented in the following Tables were purchased from DET.

Load data and less detailed data on enrolments and graduations are freely available in Tables that may be downloaded from <u>https://www.education.gov.au/higher-education-statistics</u> or compiled from the DET datacube at <u>http://highereducationstatistics.education.gov.au/</u>.

The DET website from <u>https://www.education.gov.au/higher-education-statistics</u> also includes links to annual Undergraduate Applications, Offers and Admissions reports, and to reports on Completion Rates for undergraduate students.

The QILT (Quality Indicators for Teaching and Learning) website <u>https://www.qilt.edu.au/about-this-</u> <u>site</u> provides links to the 2016 and 2017 Graduate Outcomes Surveys and the 2017 Employer Satisfaction Survey. Previous year graduate outcomes data was produced by Graduate Careers Australia. <u>http://www.graduatecareers.com.au/research/surveys/australiangraduatesurvey/</u>

ACED takes responsibility for any errors in transcribing and interpreting data from these sources.

Prof Robin W King Consultant to ACED 31 January 2018

ASCED 4-digit codes	<u>Notes:</u> Low numbers (<5) are suppressed in individual providers' returns to avoid identification of
0300 Engineering & Related Technologies 0301 Manufacturing Eng. & Tech. 0303 Process & Resources Engineering	individuals. In the aggregates some of these are resolved by subtraction. The percentages calculated ignore the <5 entries.
0305 Automotive Eng. & Tech. 0307 Mechanical & Industrial Eng & Tech. 0309 Civil Engineering	ANU, Curtin, CQUni, JCU, Murdoch UTS, UWA, WSU use code 0300 for most Bachelor degree graduates.
0311 Geomatic Eng. & Tech	CDU, Griffith, Monash, QUT and USQ and use code 0399 for most Bachelor degree graduates
0313 Electrical & Electronic Eng. & Tech, 0315 Aerospace Eng. & Tech. 0317 Maritime Eng. & Tech 0399 Other Engineering & Related Tech's	"Software engineering" does not appear specifically in the ASCED codes for either engineering or Information Technology (ASCED FOE code 02), so may be classified in the universities' returns in different ways.
	The 0301 manufacturing engineering sub-code includes "printing", "textile/garment/furniture making", that are likely to be more relevant to sub degree-level HE qualifications offered by the VET sector.
	The 0315 Aerospace Eng. and Technology includes 3-year civil aviation degrees, taken primarily by students aiming towards the aviation industry. Many of these programs offer commercial pilot training in parallel with the academic award.
	The full set of ASCED codes is at: <u>http://www.abs.gov.au/Ausstats/abs@.nsf/0/E7779A9FD5C8D846CA256AAF001FCA5C?opendoc</u> <u>ument</u>

TABLE 13 ANNUAL RETENTION RATES IN ENGINEERING FOR BACHELORS DEGREE STUDENTS IN ENGINEERING & RELATED TECHNOLOGIES, 2005 – 2015

Up to 2014, the Retention rate is the proportion of students who, in the following year, graduated or returned to the same university to study engineering. For 2015, the rate was <u>adjusted</u> to allow for re-enrolment in engineering at another university.

TABLE 14 GRADUATE EMPLOYMENT AND SATISFACTION DATA

Notes

1. Student data for FoE3 from the Higher Education Statistics ucube website

2. FoE3 includes surveying and civil aviation, and may exclude software engineering, if the university classifies the latter in IT.

3. Staff data is from DET HEd Statistics Unit, purchased by ACED, underestimates totals due to no data (nd) being recorded for some providers.

4. The number of '< 5' entries in component data are indicated. (Thus << 10 is a number in the range 2 - 8.)

5. UNSW Canberra is an additional member of ACED.
